A consumer goods multinational tracked utility use by location across its global sites

A consumer goods corporation with offices and facilities worldwide moved utility readings from local spreadsheets into one system, so consumption can be seen and compared by site.

Insight

01 The client

The client is a large multinational consumer goods corporation headquartered in Dubai, with offices, facilities and operational locations around the world.

Every site uses electricity, water and other utilities. Local teams were capturing readings, but central teams had no easy way to see consumption by site or compare one location with another.

02 The challenge

Utility readings were captured locally and kept in separate records. To understand consumption, central teams had to collect spreadsheets and build reports by hand.

- Readings sat in separate local records and spreadsheets.
- Central reporting on consumption was manual.
- Without location-level visibility, sites were hard to compare.
- Control over utility usage across the business was weak.

03 What they set up in Asset Infinity

The corporation brought utility meters and readings for every location into Asset Infinity, giving central teams one consistent view of consumption.

Energy

Meters for every location

Offices, facilities and operational locations were set up with their relevant utilities and meters, site by site.

Energy

Structured reading capture

Local teams record readings against each meter in the same way at every location, building a consumption history per site.

Insight

Consumption by location

Dashboards show consumption by facility, location and operational unit, so central teams can compare sites and spot changing patterns.

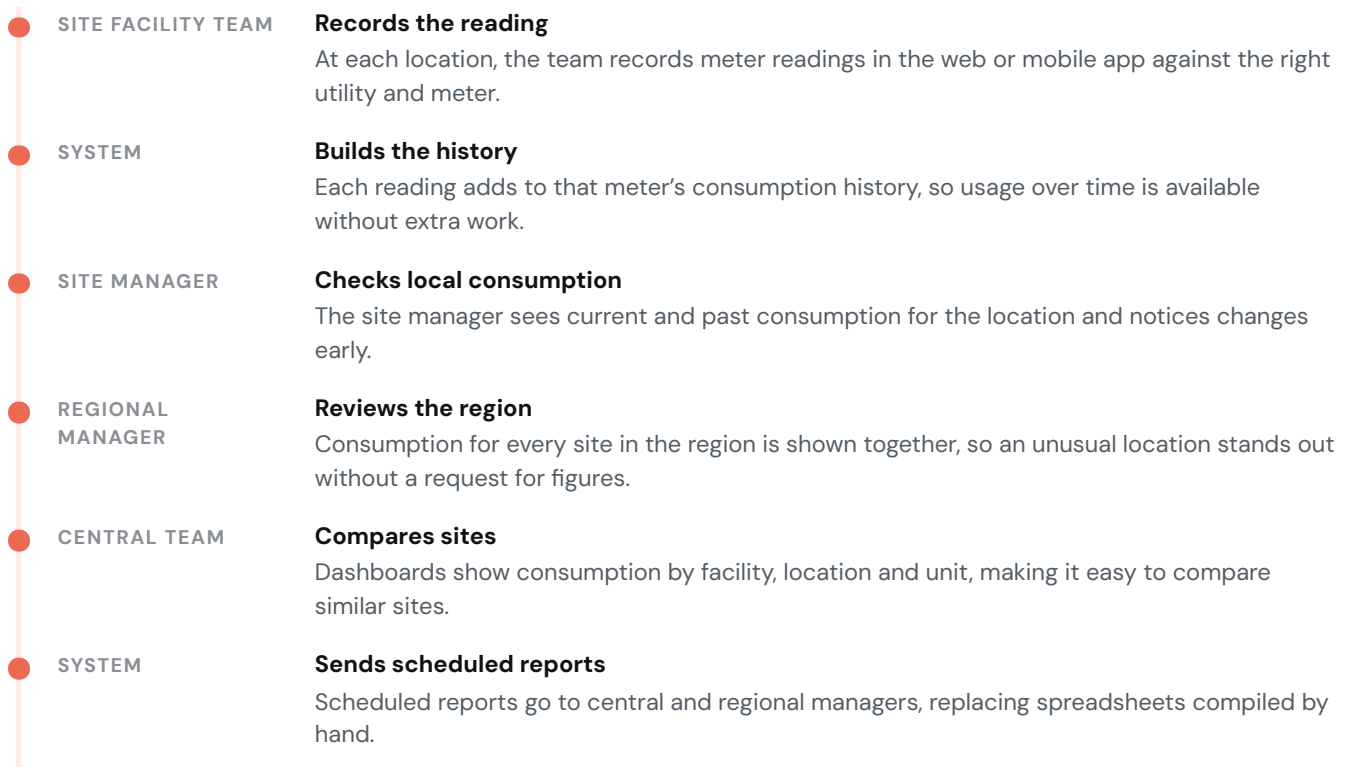

Insight

Reports without spreadsheets

Scheduled reports replace the spreadsheets central teams used to assemble from local records.

04 How it works day to day

Here is how utility data now flows from each site to head office.

05 Before and after

	BEFORE	WITH ASSET INFINITY
Readings	Captured locally in separate records	Recorded against each meter in one system
Reporting	Spreadsheets and manual reports	Dashboards and scheduled reports
Visibility	No location-level view	Consumption by facility, location and unit
Comparison	Difficult across sites	Sites compared side by side
Control	Weak oversight of usage	Central monitoring of consumption

06 How it rolled out

1

Utilities and sites reviewed. The team reviewed utility types, locations, reading practices and reporting problems.

2

Locations and meters set up. Offices, facilities and sites were configured, utilities and meters mapped, and reading capture structured.

3

Teams trained, monitoring refined. Facility teams were trained on readings and monitoring, and the setup was refined after usage data was reviewed.

07 The results

- Detailed consumption visibility across facilities, locations and units
- Readings from many locations consolidated in one place
- Easier comparison of consumption between sites
- Less dependence on spreadsheets and manual reporting
- Clearer view of usage and changing consumption patterns
- Stronger utility oversight across global operations

08 Why it worked

Same method everywhere

Every site records readings the same way, which is what makes comparisons between locations meaningful.

Granular from the start

Meters were mapped to individual locations and units, so data can be broken down as finely as the business needs.

Refined from real data

Monitoring was adjusted after reviewing actual usage data, keeping it useful to central teams.

09 Looking ahead

The corporation moved from fragmented utility records to central, location-level consumption tracking across its global sites.

Readings are captured in one structured way and consolidated automatically. That has cut manual reporting, made comparisons between sites easy and strengthened oversight of utility use across the business.
