India

A manufacturer replaced spreadsheet stock reports with live inventory dashboards

A multi-facility manufacturer moved stock records, movements and history into one system, and now plans purchasing and availability from shared dashboards instead of separately prepared spreadsheets.

Insight

01 The client

The client is a large manufacturing enterprise with multiple production facilities across India.

Stores, purchasing and production all depend on knowing what stock is on hand, how fast it is used and what will be needed next. The data existed, but turning it into decisions took a lot of manual work.

02 The challenge

Stock was being recorded, but forecasting and purchasing still relied on separate reports, spreadsheets and manual analysis by stores and purchasing teams.

- No central place to analyze inventory data.
- Little visibility into consumption patterns.
- Risk of excess stock in some items and shortages in others.
- Purchasing decisions delayed while reports were prepared by hand.

03 What they set up in Asset Infinity

The manufacturer centralized inventory records, movements and history in Asset Infinity and set up reports and dashboards for planning and purchasing.

Stores

One record of stock and movements

Stock levels, locations and every receipt, issue and transfer are recorded in one system, building the history that planning needs.

Insight

Inventory reports

Reports cover stock levels, movements, locations and usage patterns, built in the report builder instead of assembled in spreadsheets.

Insight

Dashboards by role

Operational users and managers each see the inventory information relevant to them on their own dashboards.

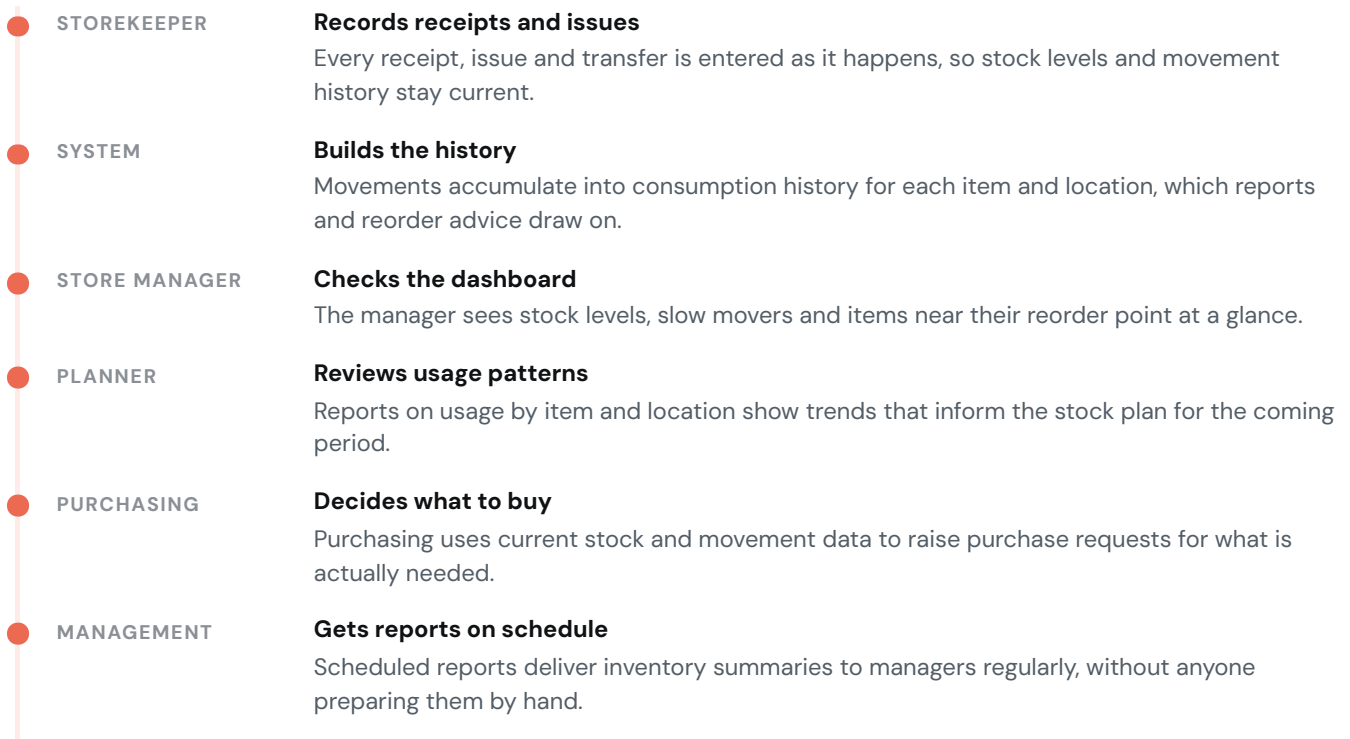

Stores

Usage-based reorder advice

Consumption history feeds reorder advice, helping teams see requirements before shortages affect production.

04 How it works day to day

Here is how inventory data turns into decisions now.

05 Before and after

	BEFORE	WITH ASSET INFINITY
Inventory reports	Separate spreadsheets, prepared by hand	Centralized reports and dashboards
Consumption patterns	Limited visibility	Usage reports by item and location
Forecasting	Manual analysis	Based on inventory trends and history
Purchasing	Delayed decisions	Based on current stock and movements
Availability	Risk of excess stock and shortages	Requirements seen before shortages

06 How it rolled out

1

Gaps reviewed. Reporting practices, planning requirements and information gaps were reviewed with stores and purchasing.

2

Data and reports configured. Inventory records, movements and history were centralized, and reports and dashboards set up for each group of users.

3

Teams trained, reports refined. Inventory teams were trained on reporting and planning, and reports adjusted as needs changed.

07 The results

- Inventory trends and history now support stock planning
- Purchasing decisions based on current stock and movement data
- Requirements identified before shortages affect operations
- Less dependence on manual spreadsheets and separately prepared reports
- Clearer visibility of stock levels, movements and availability

08 Why it worked

Data recorded once

Stock and movements are captured as they happen, so reports never need to be pieced together.

Reports for each role

Operational users and managers each see what they need, so the data gets used.

Kept up to date

Reports and views were refined as planning requirements changed.

09 Looking ahead

The manufacturer moved from manually reviewing inventory reports to planning from centralized, current data. Stock information now becomes insight for forecasting, purchasing and availability without a spreadsheet in between.

Stores, purchasing and production work from the same numbers, and reports keep pace as planning needs change.
