A textile manufacturer improved asset categorization accuracy by 40%

A textile manufacturing chain with multiple production facilities replaced manual capitalization with rule-based asset categories, depreciation and value tracking in one fixed asset register.

**40%**

improvement in asset categorization accuracy

15%

increase in financial reporting accuracy

10%

increase in operational efficiency

Insight

01 The client

The client is a textile manufacturing chain with multiple production facilities.

Each facility uses many types of assets across different production stages. Categorizing them for capitalization, tracking their values and staying in line with financial reporting standards had all been done by hand.

02 The challenge

Manual capitalization across complex production facilities led to errors and inconsistencies, and financial reports were harder to trust.

- Assets were categorized for capitalization by hand, with errors.
- Asset values were hard to track across facilities.
- Different facilities and production stages needed different criteria.
- Compliance with financial reporting standards took heavy effort.

03 What they set up in Asset Infinity

The manufacturer moved capitalization into Asset Infinity, with rules by facility and asset type, and depreciation run from the same register.

Finance

Rules for capitalization

Asset categories and capitalization criteria are set by facility and asset type, so every new asset is classified the same way.

Finance

Depreciation and values

Depreciation runs show each asset's book value over time, with book and tax figures side by side.

Platform

Approval steps

Required fields and approval steps check that each asset is correctly categorized before it is capitalized.

Insight

Reports for finance

Reports on asset values, additions and depreciation by facility support financial reporting and decisions.

04 How it works day to day

Here is how a new asset now goes from purchase to the books.

05 Before and after

	BEFORE	WITH ASSET INFINITY
Categorization	Manual, error-prone	Rules by facility and asset type
Asset values	Hard to track	Depreciation runs and book values
Facility differences	Handled case by case	Criteria for each facility and stage
Compliance	Heavy manual checking	Approval steps before capitalization
Reporting	Inconsistent	15% more accurate

06 How it rolled out

1

Needs assessed. The client and the Asset Infinity team reviewed capitalization challenges and reporting needs across facilities.

2

Criteria configured. Categories and criteria were set up for each facility and asset type used in production.

3

Checks in place. Approval steps were added so categorization is checked against financial standards.

07 The results

10%

improvement in categorization aligned with production stages

5%

improvement in informed decision-making

- Fewer errors and more consistent financial reporting.
- Less administrative effort in capitalization.

08 Why it worked

Rules, not judgment calls

Criteria set once by facility and asset type mean every new asset is treated the same way.

Finance checks first

Approval steps catch a wrong category before it reaches the accounts.

One register for all

Values, depreciation and asset details live together, so reports match the assets on site.

09 Looking ahead

By setting capitalization rules by facility and asset type, the manufacturer improved categorization accuracy by 40% and financial reporting accuracy by 15%.

Finance and operations now work from one fixed asset register, so the values that reach the accounts match the assets on the factory floor.
